# IR CONTROL

## QUICK FACTS

- CAPABLE OF CONTROLLING UP TO 1,000 TELEVISIONS IN A FACILITY SIMULTANEOUSLY FROM A HOST COMPUTER
- CONTROL THE PRESENTATION OF MULTIPLE RACES ON A VARIETY OF TELEVISION MONITORS
- RACING FANS SEE WHAT YOU WANT THEM TO SEE WHEN YOU WANT THEM TO SEE IT

ISC's IR Control system allows a racing facility to control its televisions from a remote location without the use of hand-held remote controls. The system is capable of controlling up to 1,000 televisions simultaneously from a host computer. This allows you to dynamically control the presentation of multiple races on a variety of television monitors at your OTB or ITW facility.

The host computer communicates with small, individually numbered control units that are placed on televisions throughout the facility. An operator, in a remote location in the facility or on the simulcast floor with a wireless tablet, can control the individual televisions or groups of televisions either manually or via macros executed by clicking on a button on a computer screen.

With ISC's IR Control system, you will be ensured that racing fans see what you want them to see when you want them to see it and that your simulcast signals will be evenly distributed throughout your facility.
